

CSS Flex

Flexbox

✳️👁️ Flexbox is a one-dimensional layout model, where flex means flexible length on flexible items.

- The flexbox layout must have a **parent element(container)** with the **display** property "**flex**". So that the child elements of the container automatically become **flex items**.
- Flexbox provides an easy way to arrange items within a container.

Flexbox

Uses of
Flex box

Important
Terminologies

Flex properties

Example

- Flexbox **aligns and distributes space** among the items in the container even when the size of the items is unknown or dynamic.
- Flexbox expands/shrinks to fill available space/prevent overflow and distributes space among the items.
- Flexbox is used for creating small-scale layouts.
- Flexbox aligns the items vertically and horizontally using rows and columns.

Flexbox Uses

- The flexbox makes the website/web app behave in a similar manner even when they are viewed on different devices that have different screen sizes.
- To create responsive and mobile-friendly websites/web apps flexbox can be used.

Important Terminologies

- The two main components of flexbox are flex container and flex item.
 - **Flex container:** Property of parent element that is declared with display property flex.
 - **Flex item:** Properties of child elements. There may be one or many flex items.

```
.flex-container {  
  display: flex;  
}
```

Uses of
Flex box

**Important
Terminologies**

Flex properties

Example

Important Terminologies

- Flex layout is based on **flex-flow directions**, which are used in displaying the flex items. Flexbox has two axes.
 - Main axis**: The primary axis along with the flex items are laid out. *x-axis*
 - Cross axis**: The axis **perpendicular** to the main axis is called cross axis. *y-axis*
